

### SAPS system [1]

The system allows users to submit statements online and get a case number. It also includes an API that displays crime hotspots using google maps to advice the user about the crime rate wherever they're residing at. The App will have a "selfie" option to draw the police by showing them the seriousness of the crime. It will provide information about finding nearest police stations and the time it would take for units to respond.

### No more walk-ins [2]

An innovative way to university late applications. Our plan is to help those who didn't apply during the previous year to do late applications in four universities for five to twenty different fields of study in one go. The applicants only upload their marks and the supporting documents, then they choose five available fields, our system then finds them a university or universities they can go register at.

### BooksWeShare.com [3]

The web application will be a system that connects a second hand book seller and the buyers. It will consist of a tags for all faculties, with each consisting if  $x$  amount of books as uploaded by the web members (sellers). Buyers can then view the books and place their order with a proposed fee. The member will write the book price and chose who to sell it to.
